1 2. (Currently amended) A universal collar that attaches to a pump and, in turn, a
2 container used in a dispenser having a keyplate, where the universal collar is
3 adapted to bypass the keying system within the dispenser while securing the
4 container therein, the universal collar comprising:

a body having a first flange and a second flange, wherein said flanges extend outward and are axially spaced from each other for receiving the keyplate therebetween, wherein said flanges are connected on a forward side of the universal collar by a vertically extending rib, wherein said rib is adapted to interact with the dispenser to prevent rotation of the container once inserted.

- 3. (Currently amended) A universal collar that attaches to a pump and, in turn, a container used in a dispenser having a keyplate, where the universal collar is adapted to bypass the keying system within the dispenser while securing the container therein, the universal collar comprising:
  - a body having a first flange and a second flange, wherein said flanges extend outward and are axially spaced from each other for receiving the keyplate therebetween, wherein at least one of said flanges defines a notch on a rearward side thereof for receiving a projecting portion of the dispenser.
- 1 4. (Original) The universal collar of Claim 3, wherein said notch is centered within said flange on said rearward side.

Reply to Final Office Action of November 13, 2006

1 5. (Currently amended) A universal collar that attaches to a pump and, in turn, a
2 container used in a dispenser having a keyplate, where the universal collar is
3 adapted to bypass the keying system within the dispenser while securing the
4 container therein, the universal collar comprising:

a body having a first flange and a second flange, wherein said flanges extend outward and are axially spaced from each other for receiving the keyplate therebetween, wherein said body includes a top edge, said top edge defining a locating recess for receipt of a projection on the container, said recess having a base and a pair of upstanding sides, wherein said sides are circumferentially spaced from each other for receipt of the projection therebetween.

- 1 6. (Original) The universal collar of Claim 5, wherein one of said sides extends
  2 perpendicular to said base and the other of said sides extends obliquely relative to
  3 said base.
- 7. (Original) The universal collar of Claim 5, wherein said top edge extends axially upward relative to said first flange and extends in a circular fashion to circumscribe a portion of the container.
  - 8. (Canceled).
- 9. (Previously presented) A universal collar comprising a hollow cylindrical collar having a first flange and a second flange extending at least rearwardly therefrom, and axially spaced to define a receiver clearance therebetween, wherein said flanges extend radially outward from said collar, each flange defining a notch that opens rearwardly relative to said collar.
  - 10. (Canceled).
  - 11. (Canceled).
